Video Quality

Video quality is optimized by determining the size and the speed to transmit MPEG packets to the TV.

The packet latency and delay variation are adjusted automatically by the Modulator to reach the best video quality and performance on the TV.

- H.264 encoding support is required by the DVB-T service.
- No HDCP (High-bandwidth Digital Content Protection) agreement (e.g. Blue-Ray Disc) is not supported.

Audio Codec

Audio encoding is automatically selected by the Modulator to reach the best quality according to local modulation technique.

MPEG MPEG-2 Layer 1 audio coding applies to DVB-T broadcasting in Europe and South America.

ACC Advanced Audio Coding for MPEG-4 applies to ISDB-T broadcasting in South America.
